

Cycling with Arthritis: A Low-Impact Way to Keep Moving

Cycling is one of the best exercises for arthritic joints. Learn how to set up your bike, choose the right type, and ride comfortably.

Cycling is consistently recommended by rheumatologists and physiotherapists as one of the best exercises for arthritis. It's low-impact, builds leg strength, improves cardiovascular fitness, and can be adapted to almost any ability level.

Why Cycling Works for Arthritis

****Minimal joint loading:**** Unlike walking or running, cycling is non-weight-bearing — your body weight is supported by the saddle. This makes it suitable for moderate to severe knee, hip, and ankle arthritis.

****Controlled range of motion:**** The circular pedalling motion takes joints through a smooth, predictable range — lubricating cartilage with synovial fluid and reducing stiffness.

****Muscle strengthening:**** Pedalling primarily targets the quadriceps, hamstrings, glutes, and calves — the key muscle groups that support arthritic knees and hips.

****Cardiovascular fitness:**** A 2018 Cochrane review confirmed that aerobic exercise (including cycling) reduces pain and improves function in knee and hip OA.

Types of Cycling

****Stationary/exercise bike:**** Best for beginners or during flare-ups. No balance required, controlled environment, and you can stop instantly. Recumbent bikes (with back support) are excellent for hip and back arthritis.

****E-bikes (electric-assist):**** The game-changer for arthritis cycling. E-bikes provide motor assistance when you need it — up hills, into headwinds, or when fatigue hits. They let you ride further with less joint stress. UK e-bike sales have surged, and prices now start from around £800.

****Standard road/hybrid cycling:**** For those with mild to moderate symptoms. Hybrid bikes with upright geometry are more comfortable than racing bikes.

****Adapted cycling:**** Tricycles, recumbent trikes, and hand cycles are available through Cycling UK's Cycling Without Age programme and many local Wheels for All centres.

Bike Setup for Arthritis

****Saddle height:**** When seated, your knee should have a slight bend (25–30°) at the bottom of the pedal stroke. Too low = excess knee compression. Too high = hip rocking.

****Handlebar height:**** Raise handlebars higher than the saddle to maintain an upright position — this reduces strain on wrists, shoulders, and lower back.

****Pedals:**** Platform pedals (not clipless) let you reposition your feet during the ride. Add toe cages if you want some security without the commitment of cleats.

****Grips:**** Ergonomic grips (like Ergon GP1) distribute pressure across the palm rather than concentrating it on the fingers — essential for hand arthritis.

****Gear ratios:**** Use low gears and spin at a higher cadence (70–90 RPM) rather than pushing hard in high gears. High resistance = more joint force.

Getting Started

****Week 1–2:**** 10 minutes on a stationary bike, low resistance, every other day ****Week 3–4:**** Increase to 15–20 minutes, gentle resistance ****Week 5–6:**** Try 20–30 minutes, or venture outdoors on flat routes ****Ongoing:**** Build to 30–45 minutes, 3–4 times per week

UK Resources

- ****Cycling UK:**** Offers inclusive cycling programmes and route suggestions
- ****Wheels for All:**** Centres across the UK providing adapted cycles and supported sessions
- ****British Cycling Breeze:**** Women-only social rides at a gentle pace
- ****Sustrans:**** National Cycle Network with traffic-free routes

Key Takeaway

Whether it's a stationary bike in your living room or an e-bike through the countryside, cycling lets you stay active, protect your joints, and enjoy the freedom of movement that arthritis tries to take away.

Q&A

Question: What is the key thing to know about cycling with arthritis: a low-impact way to keep moving?

Short answer: Cycling is ideal for arthritis as it's low-impact, supporting your body weight and reducing joint loading. The circular pedalling motion lubricates cartilage and strengthens leg muscles supporting knees and hips. Stationary, e-bikes, and adapted cycles offer options for all abilities, with correct bike setup, including saddle and handlebar height, crucial for comfort and joint protection.

Question: When should I seek professional advice?

Short answer: If symptoms persist or worsen, pain is severe and unresponsive to usual relief, or you develop new symptoms, contact your GP, physiotherapist or rheumatology team promptly.

Question: Where can I get free arthritis support in the UK?

Short answer: Arthritis UK: 0800 5200 520. NRAS: 0800 298 7650. Free tools and guides at livingwitharthritis.org.uk.
